

Doctolib - Live Case Study

Patient <> Pro Workflow

Design Engineer

About the exercise

In this live exercise, we will provide you with a problem statement as a **Design Engineer** responsible for the **design infrastructure** across our People-facing products and our all-in-one professional software, Doctolib Pro.

We would like to understand how you approach problems, integrate different constraints when exploring ideas, move projects forward, and would work with stakeholders. Above all, we want to understand how you think.

Deliverables and Assessment

Assessment: We will assess your ability to:

- Focus on what matters
- Structure a problem and solution
- Communicate clear and justified choices
- Consider technical, design, user, and other tradeoffs
- Think as a design leader, not only as a designer

Deliverables: At the end of this exercise, we would like to see:

1. A **design direction**, expressed as sketches, diagrams, or in words
2. A **design engineering solution** that enables execution at scale

On solution fidelity: For this interview stage, we value the quality of your thinking over pixel-perfect, high-fidelity prototypes or usable code. We recommend keeping assets simple and clear, ensuring that your materials convey a complete idea and successfully feed the subsequent discussion.

Agenda (90 mins)

The 90 minutes for this exercise will be broken down as follows:

- **10 mins:** Introduction and brief reading
- **40 mins:** Work independently or collaboratively with your interviewer, depending on your personal preference. Whether you choose to work independently or collaboratively does not influence the outcome.
- **15 mins:** Solution presentation
- **20 mins:** Q&A

Tools

We will provide access to our staging environment and key product screenshots for context. We ask that you bring your own tooling (pen and paper, Figma/FigJam, Miro, Claude) for the independent work portion of the interview. You are welcome to use AI as a part of your process.

Test our Product

Access Doctolib Pro sandbox to explore our B2B product:

- [Access Doctolib Pro](#)  or [Doctolib Pro DE](#)  (add “?locale=en” at the end of the URL to get the English version)
- email access : casestudydoctolib+demo@doctolib.com
- password: DoctocaseC2022? (and if needed Pin: 2025 if that doesn't work)
-  **First login: the first time you connect, a verification code will be sent to your recruiter, who will pass it on to you straight away. Make sure to do this during working hours so they can assist you quickly! Once you're in, you'll be able to log in freely using your PIN or password. Just remember to stay on the same device and avoid clearing your cookies to avoid having to repeat this step.**

Problem Statement

At Doctolib, we are uniquely positioned to provide best-in-class solutions to both healthcare providers and patients because we cover all parts of the care journey, across both patient and professional workflows.

During consultations, practitioners spend significant time on:

- Note-taking
- Prescription creation
- Administrative workflows

...reducing the time and quality of interaction with patients.

Imagine that we've recently introduced a way for an AI assistant to inquire about a patient's recent history through our patient app, in the days leading up to an appointment, to gather context for the healthcare practitioner.

The problem statement we'd like you to address is: How might we leverage a design engineering approach to accelerate our discovery and delivery processes for this feature?

***Disclaimer:** the workflow described below already exists in Doctolib supported by several teams. The ideas generated by you during this exercise will only be discussed during the exercise and will not be used by Doctolib afterwards.*

Solution Components

Please ensure that your solution includes the following elements:

1. Design Solution

- What is the main idea?
- What are the key decisions or assumptions you've made regarding technical, design, or user constraints?
- What is the larger design and business strategy around your solution, such as design principles and scalability?
- What is the value and impact for professionals, and patients?

2. Execution and Design Engineering

- What **key assumptions and questions** does your solution raise regarding our design system?
- What **design infrastructure** is required to make your solution scalable with AI, and how would you approach **building** it? What pitfalls would you avoid?
- What are the **first steps** you would take in the next 2-4 weeks?
- How would you involve **different stakeholders** throughout the process?
